

Comparing small businesses in tariffed industries (to be researched), against small businesses in untreated industries (to be researched), while simultaneously comparing them against large firms in those same sectors.

Data:

- Specific tariff amounts for each industry and year: <https://dataweb.usitc.gov/tariff/annual>
- Business trends survey: https://www.census.gov/hfp/btos/data_downloads
 - Look at business distress and has data by sector and by size.
- Query to get further tariff rates and specifically amounts of effecting imports per country: <https://dataweb.usitc.gov/trade/search/Import/HTS>
- Bankruptcy statistics: <https://www.abi.org/newsroom/bankruptcy-statistics>
 - Subchapter V is typically small businesses and Chapter 11 is larger
- State unemployment records (jobs created and destroyed): <https://ledextract.ces.census.gov/>
- Import and export codes to link with tariff data for industry: <https://www.census.gov/foreign-trade/aes/concordance.html>

Steps:

1. Download tariff amounts and import volumes from USITC DataWeb to get a list of HTS codes and corresponding tariff rates for each month and year.
 - a. Use Concordance Table to translate HTS product codes to NAICS industry codes.
2. Pull business district metrics for 2018-2019 to 2025-2026 using unemployment rates and for 2025-2026, look at BTOS survey.
 - a. Table showing business distress per NAICS Industry by firm and size per time period
3. Clean data - aggregate monthly data to quarterly, deal with missing information, etc.
4. Join two resulting tables together where every row is a specific industry in a specific month broken down by size and showing how high the tariff was and how many jobs were lost/businesses failed.
